

Module Handbook

**for the Master's program
Agriculture, Ecology and Societies**

**at the
University of Kassel
Faculty of Organic Agricultural Sciences**

Version: July 31st, 2024

Inhalt

Compulsory modules	4
Food systems governance and agriculture	4
Agriculture and ecosystem services	5
Interdisciplinary Project.....	7
Master thesis and colloquium	8
Bridging modules	10
Research methods in social sciences	10
History, Societies and Environment.....	11
Research methods and data science in the life sciences	13
Organic livestock farming under temperate conditions	14
Principles of organic farming	16
Soil and plant science	17
Compulsory elective modules I: Agriculture and Ecology	19
Unconventional livestock and wildlife	19
Social-ecology in livestock production systems.....	20
Livestock nutrition and feed evaluation under (sub)tropical conditions	22
Livestock-based sustainable land use	23
Digitalization in livestock systems.....	25
Grassland-based livestock systems and climate change mitigation	27
Innovative sustainable breeding.....	29
Management of (sub-)tropical landuse systems.....	31
Applied statistical modelling.....	32
GIS and remote sensing in agriculture.....	33
Sustainable diets	35
Participatory research methods for sustainability.....	36
Modelling climate impacts on agroecosystems	38
Organic agriculture in Europe	40
Sustainable land-use and climate mitigation.....	41
Biodynamic agriculture	43
Food processing	44
Ecology and agroecosystems.....	45
Organic cropping systems under temperate and (sub)tropical conditions	46
Agrobiodiversity and plant genetic resources in the tropics	48
Nutrient dynamics, experimental design and statistical modelling - bilingual	49
Digitalization in agriculture	50

Biochar for Environmental Management	52
Soil-plant interactions.....	53
Water in the soil plant-system	55
Nutrient acquisition by plants.....	56
Compulsory elective modules II: Society and environment	58
Marketing research.....	58
International organic food markets and marketing.....	59
Strategic management.....	60
Management and management accounting.....	62
Rural sociology.....	63
Critical perspectives on the global food system	64
EU policies, organic farming and food system transformation.....	66
Sustainable food systems and management	68
Sustainability-oriented environmental social science	69
Climate change governance	71
Sustainable? Development?.....	72
Environment and health.....	74
Education for sustainable development and agriculture	76
One health: human, animal and environmental interactions	78
Philosophy of sciences	79
Philosophy of environment and society	81
Global political economy and development.....	82
Methods of sociology and humanities	83
Spatial dimensions of sustainability transitions.....	85
Supply chain management.....	86
Sustainable behaviour and governance	87
Decision support tools in sustainability management.....	89

Compulsory modules

Food systems governance and agriculture

Module number / code	E46
Module name	Food systems governance and agriculture
Type of module	Compulsory module
Learning outcomes, acquired competencies and qualification goals	<p>Students</p> <ul style="list-style-type: none"> • will understand the food system concept and the role of governance and institutions within it against the background of the European Union, and its role for and interactions with diverse production systems worldwide • will obtain an overview of the ways in which the many European food systems and demands for agricultural produce shape local agriculture and rural areas in Europe and worldwide • will obtain an overview of the role of policies, governance arrangements and institutions for the way Europe shapes global food systems and agriculture • will become familiar with a public choice and institutionalist perspective on public policy making • will become familiar with a constitutional, new institutional economic and a critical institutionalist perspective on food system interactions and their change • will reflect on the concepts of the course throughout seminar discussions • will explore analytical tools throughout issue-related discussions with practice partners.
Course types	Seminar 60h
Content	<p>Agricultural production is nowadays conceived as integral part of global food, feed, fuel, and fibre-related supply systems. The European Union plays a major role in structuring global agriculture, food and supply systems. Policies structuring governance and institutions are core elements shaping economic exchange in the food system and the exploitation of natural resources. The course covers what food and agricultural systems are, what roles policies, governance and institutions play in these, and how the European Union's structure of agricultural production shapes them. To explain policy outcomes, the course relies on a public choice and institutionalist perspective. For analyzing the food system, it further introduces new and critical institutionalist approaches and collective action theory, and illustrates these through case materials and literature discussions. Analytical perspectives will further be explored through the discussion of various European governance issues with practice partners and policy makers.</p>
Title of courses	Food systems governance and agriculture
Teaching and learning methods	Lecture, seminar, group works, virtual and in presence stakeholder meetings, excursions, presentations, readings
Usability in other programs	Obligatory module according to §9(3) Examination Regulations Master AGES

Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Five literature discussions in groups (each appr.. 1500 words) Grade weighting P1: 40% Examination P2: Oral presentation (appr. 20min) or Oral examination (25min) or Written report (appr. 2500 words) Grade weighting P2: 60%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw.u.Ök.Landwirtschaft
Responsible person	Prof. Dr. A. Thiel
Lecturer(s)	Prof. Dr. A. Thiel and staff
Media used	In correspondence with instruction type
Recommended literature	Literature and seminar papers will be circulated to students at the beginning of term

Agriculture and ecosystem services

Module number / code	I20
Module name	Agriculture and ecosystem services
Type of module	Compulsory module
Learning outcomes, acquired competencies and qualification goals	This course will introduce students into the concepts of ecosystem services and human well-being, with a particular focus on their relevance for agriculture and other land uses. It will foster the ability of students to assume an interdisciplinary research perspective (including ecological, socio-cultural, and economic approaches) and to critically discuss and analyse the concept of ecosystem services in its multiple scientific, political and practical meanings.
Course types	Seminar 60h

Content	<p>Global environmental assessments (e.g., the Intergovernmental Platform on Biodiversity and Ecosystem Services, IPBES) have highlighted that human well-being is critically dependent on ecosystem services – the benefits that nature provides to people. Depending on the particular land-use system and its social-ecological context, agriculture can either degrade or enhance such ecosystem services. This course gives an overview on the rising field of ecosystem services science. Focus will be on:</p> <ul style="list-style-type: none"> • techniques for decision support, • practical applications of the approach in agriculture and other land-use sectors, and • linkages to other sustainability issues (e.g., biodiversity, climate change, water security, poverty). <p>These topics will be outlined in lectures and deepened in seminars and field exercises, where key issues will be explored and critically discussed.</p>
Title of courses	Agriculture and ecosystem services
Teaching and learning methods	Lecture, seminar
Usability in other programs	Obligatory module according to §9 (3) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	<p>Examination P1: Presentation (appr. 30min) Grade weighting P1: 50% Examination P2: Written report (max. 8000 words) Grade weighting P2: 50%</p>
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. T. Plieninger
Lecturer(s)	Prof. Dr. T. Plieninger and staff
Media used	divers

Recommended literature	Potschin M., Haines Young R., Fish R. and Turner R.K. 2016: Routledge Handbook of Ecosystem Services. Routledge Earthscan; London, New York.
-------------------------------	--

Interdisciplinary Project

Module number / code	-
Module name	Interdisciplinary Project
Type of module	Compulsory module
Learning outcomes, acquired competencies and qualification goals	<p>Students are able to work independently in a group of limited size and interdisciplinary composition and with some guidance, to answer the inter- or transdisciplinary scientific questions derived from the topic in the field of agricultural and food systems affected by Europe's needs for or supply of food, fibres and biomass,</p> <p>To achieve this goal, they acquire the following competencies:</p> <ul style="list-style-type: none"> • Teamwork • Structuring complex group work towards a common goal • Independent data collection and analysis • Synthesis of group work • In-depth processing of social, humanistic, agronomic or utility animal scientific ecological sub-questions • Literature analysis • Exchange with stakeholders • Presentation and discussion of research and work results
Course types	Project work 360h
Content	<p>Content related: Students work on an interdisciplinary project optionally in different contexts such as soil, plant, animal, economic and/or social.</p> <p>Supra-content related: Planning, implementation and evaluation as well as presentation of the results of a project (field experiment, laboratory experiment, empirical study or similar).</p>
Title of courses	Interdisciplinary project
Teaching and learning methods	Project work
Usability in other programs	Obligatory module according to §9 (3) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	Summer und winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-

Required prerequisites for participation	-
Student workload	360 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Project report (appr. 10.000 words) Grade weighting P1: 70% Examination P2: Group presentation (appr. 30min) Grade weighting P2: 30%
Credit points (ECTS)	12 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. A. Thiel
Lecturer(s)	Two lecturers of Master AGES representing different disciplines
Media used	Depending on theme
Recommended literature	Depending on theme, initial literature provided by lecturers

Master thesis and colloquium

Module number / code	-
Module name	Master thesis and colloquium
Type of module	Compulsory module
Learning outcomes, acquired competencies and qualification goals	<ul style="list-style-type: none"> • Independent preparation of a scientific paper in an area of agricultural sciences on a topic of the student's choice. • Students should combine the theories, approaches and methods learned during their studies, document methodological confidence and reflection, generate independent theses and reflect on them against the background of the international research discourse. • Presentation of the planning and progress of the independent research process and its methodological foundations in the study colloquium. • Presentation and professional discussion of the work in the final colloquium.
Course types	Eigenständiges Projekt, Recherche und Auswertung
Content	The topic and content can be chosen by the student and agreed upon with the supervisor. Some teachers also offer topics.
Title of courses	Master thesis and colloquium
Teaching and learning methods	Own project, research and evaluation
Usability in other programs	Obligatory module according to §10 Examination regulations Master AGES

Duration	22 weeks for thesis
Frequency of module offer	Summer und winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	at least 78 credits according to §9 Examination regulations Master AGES
Student workload	900h, number of contact time varies
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Master thesis (appr. 40.000 words) Grade weighting P1: 75% Examination P2: Colloquium (60min) Grade weighting P2: 25%
Credit points (ECTS)	30 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Dr. L. Thiemann
Lecturer(s)	all lecturers of Master AGES
Media used	verschiedene
Recommended literature	Scientific publications on the agreed topic in consultation with the supervisors

Bridging modules

Research methods in social sciences

Module number / code	F16
Module name	Research methods in social sciences
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>The aims of the module are:</p> <ul style="list-style-type: none"> • To understand the philosophical bases of research in the social sciences; • To foster students' understanding of key techniques for collecting and analysing qualitative and quantitative data and their relative strengths and weaknesses; • To be aware of the linkages between theory, data, analysis and interpretation and of the role and impact of the researcher in the research process; • To improve accessibility of research material, such as, journal articles; • To provide more advanced skills in support of other modules and dissertation research involving quantitative and qualitative analysis.
Course types	Seminar 30h, Übungen 30h
Content	<ul style="list-style-type: none"> • Principles, practicalities and issues of using qualitative and quantitative research methods typically found in the social sciences; • Concepts (e.g. ontology, epistemology and methodology) and how these form research questions and data analysis; • Techniques for collecting and analysing qualitative data, e.g. interviews and focus groups; • Techniques for collecting and analysing quantitative data, e.g. statistics, hypothesis testing, sample design, multiple regression analysis, multiple analysis of variance, factor analysis, cluster analysis.
Title of courses	Research methods in social sciences
Teaching and learning methods	Seminar, Übung
Usability in other programs	<p>Bridging module according to §7 (3) Examination Regulations Master IFBC</p> <p>Bridging module according to §10 (5) Examination Regulations Master AGES</p>
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-

Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Written report (appr. 750 words) Grade weighting P1: 25% Examination P2: Written test (appr. 120min) Grade weighting P2: 75%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Dr. T. Krikser
Lecturer(s)	Dr. T. Krikser
Media used	various
Recommended literature	Bryman, Alan 2012: Social research methods. 4. ed. Oxford: Oxford Univ. Press. Dillman, Don A.; Smyth, Jolene D.; Christian, Leah Melani 2009: Internet, mail, and mixed-mode surveys. The tailored design method. 3. ed. Hoboken, NJ: Wiley. Field, Andy 2018: Discovering statistics using IBM SPSS statistics. 5th edition. Los Angeles, London, New Delhi, Singapore, Washington DC, Melbourne: SAGE (SAGE edge).

History, Societies and Environment

Module number / code	K51
Module name	History, Societies and Environment
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students are knowledgeable in historical, sociological and philosophical perspectives on and tentative explanations of the dynamics of European agro-based and food economies. They understand bio-economics in their global contexts and in connection with questions of sustainability (Climate protection, biodiversity, adaption to climate change, social justice, and economic feasibility). Debates on sustainability are not only linked to economic, judicial and ethical aspects, but also to questions on cultural diversity and its suppression. This, in turn, comes with clear systemic implications. Students, thus, gain insights into questions and controversies attached to the linkages of migration and agriculture, education and environment, gender and labor, animal usage and domination.</p> <p>Students reflect on fundamental questions regarding human-nature, human-environment and human-animal relations, ethnicized economies and gender (in)equalities. Thus, the role of nature, the environment and animals in Western and non-Western schools of thought, histories of ideas and societies at large, particularly with view of colonial entanglements, are investigated as are the material interactions between humans and their surrounding environment(s). Students equally reflect on meta narratives such as those on modernity, civilization and North-South dualisms. With</p>

	<p>regard to concrete social practices in diverse fields such as science, economy, labor and agriculture, they are able to understand and analyze long-term developments and transformative processes in their historical contexts and meanings. These include, for example, the history of domestication as economic praxis, the transfusion and production of knowledge on and about “nature”, the socializing impact of animals, the history of agriculture, animal husbandry and food production, as well as of patterns of consumption. Just as important for this kind of analysis is the reflection of these developments as results of a Longue Durée, of epoch-shaping transformative processes, climate change etc. (Keyword: “Anthropocene”).</p> <p>Students learn how to apply central investigative perspectives and categories used by the social sciences, cultural studies and the humanities (gender, class, race, ethnicity, religion, geographical area, species etc.). They draw on approaches provided by, for example, Postcolonial Studies, Gender Studies, Cultural and Historical Anthropology, Critical Sustainability Studies, Human-Animal Studies and Multispecies Studies respectively, as well as Environmental Humanities. By means of working on exemplary topics, students gain insights into methods used by the sociology and history of philosophy, animals and the environment. They also learn how to work in interdisciplinary team. On this basis, students are able to develop their own research questions and to take the necessary methodological and organizational steps to work on them (research and writing skills).</p>
Course types	Seminar 30h
Content	alternates, depending on disciplinary affiliation
Title of courses	History, Societies and Environment
Teaching and learning methods	alternates, depending on disciplinary affiliation
Usability in other programs	Bridging module according to §9(5) Examination regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 30 hours contact
Required course work	S1: Maximum of two course projects as directed by the course instructor: presentation, report, protocol, excerpt, essay, interview, source criticism, hosting of a class, simulation, podcast, paper, poster and the like.
Prerequisites for examination(s)	
Module examination(s)	Written report (appr. 7.000 words)

Credit points (ECTS)	6 cp
Teaching unit	Gesellschaftswissenschaften
Responsible person	PD Dr. M. Roscher
Lecturer(s)	PD Dr. M. Roscher, Prof. Dr. H. Büschel, Prof. Dr. E. Tuidier, Prof. Dr. B. Langfeldt, Prof. Dr. K. Köchy (FB 02), D. apl. Prof. Dr. D. Stederoth (FB 02), Prof. Dr. C. Neu
Media used	alternates, depending on disciplinary affiliation
Recommended literature	alternates, depending on disciplinary affiliation

Research methods and data science in the life sciences

Module number / code	I29M
Module name	Research methods and data science in the life sciences
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students have an understanding of the methods of quantitative and qualitative data collection in the life sciences and the different sampling techniques and experimental designs. They are able to apply standard data analysis techniques. They understand the usefulness and limitations of selected multivariate approaches for regressions and pattern recognitions in the data science and learn the concepts of different machine learning approaches. They are able to apply the acquired skills in the analysis of their own MSc (and PhD) datasets.
Course types	Vorlesung 40h, Übungen 20h
Content	<p><i>Research methods and standard analyses in the life sciences:</i></p> <ul style="list-style-type: none"> • Introduction to methods of quantitative and qualitative data collection in the life sciences • introduction to sampling techniques and experimental design • Description and exploration of data, visualization using univariate and bivariate plotting and application of standard statistical techniques (regressions and analyses of variance) <p><i>Data science in the life sciences:</i></p> <ul style="list-style-type: none"> • Application of multivariate approaches: principal component analysis (PCA) and regression (PCR), cluster analyses, factor analyses • Introduction to machine learning: perceptron, artificial neural networks, regression trees, rule-based models and support vector machine classification and regression
Title of courses	Research methods and data science in the life sciences
Teaching and learning methods	Lecture, exercisess

Usability in other programs	Compulsory elective module according to §9(5) Examination Regulations Master AGES; Method module Bridging module according to §7(3) Examination Regulations Master IFBC
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Oral test (30 min)
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. B. Ludwig
Lecturer(s)	Prof. Dr. B. Ludwig and staff

Organic livestock farming under temperate conditions

Module number / code	A14
Module name	Organic livestock farming under temperate conditions
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Animal nutrition and animal health: Students have a basic understanding of farm animal nutrition and health management; they understand the challenges emerging in organic livestock systems

	<p>related to both animal nutrition and animal health and know how to assess, quantify, evaluate and approach these challenges.</p> <p>Animal welfare: Students have a basic understanding of animal welfare, familiarise with different organic husbandry systems, practical problems and scientific concepts including how to assess animal welfare both at farm and system level.</p>
Course types	Seminar 60h
Content	<p><i>Course: Animal nutrition and animal health:</i> Principles and regulations of organic livestock farming in Europe; Nutrition in organic cattle, pigs and poultry; Animal health and production diseases; Production diseases in organic cattle, pigs and poultry; Health management in organic livestock farms</p> <p><i>Course: Animal Welfare:</i> Principles of animal welfare in relation to organic farming; scientific methods of welfare assessment; organic livestock husbandry.</p>
Title of courses	Organic livestock farming under temperate conditions
Teaching and learning methods	Lecturing, self-study, textbook assignments, group work, group discussion, student presentations, excursions.
Usability in other programs	Bridging module according to §9 (5) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge of animal sciences.
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	<p>Examination P1: Written test (120min) Grade weighting P1: 100%</p> <p>Examination P2: Written test (60min) 70% and Oral presentation (appr. 20min) 30% Grade weighting P2: 100%</p>
Credit points (ECTS)	6 cp

Principles of organic farming

Module number / code	F17
Module name	Principles of organic farming
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students are able to describe</p> <ul style="list-style-type: none"> • the principles and structures as well as functions of agricultural ecosystems in general • nutrient cycles and their management in agriculture • systems of land use and their ecological impact • nutrient management as based on cropping techniques in organic agriculture • principles of organic pest management • principles of organic animal husbandry
Course types	Seminar 60h
Content	<ul style="list-style-type: none"> • Various relevant theories of low-input and intensive organic agriculture • Structures and functions of agricultural ecosystems in general • Development, evaluation and comparison of ecological crop management systems on the background of various natural, economic and socio-cultural circumstances • Principles of pest management and fertilisation in organic agricultural systems • Principles of animal husbandry in organic agricultural systems • The biodynamic approach – an integral basis of organic agriculture and differentiation of organic and conventional food quality on the example of milk and effects on human health
Title of courses	Principles of organic farming
Teaching and learning methods	Presentations, discussions and conclusions in form of closing sessions in plenum
Usability in other programs	Bridging module according to §9 (5) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester

Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral presentation (appr. 10min) Grade weighting P1: 40% Examination P2: Written report (appr. 3500 words) Grade weighting P2: 60%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. M. Athmann
Lecturer(s)	Prof. Dr. M. Athmann, Prof. Dr. U. Niggli, Dr. D. Kusche
Media used	verschiedene
Recommended literature	Lecture based materials

Soil and plant science

Module number / code	P07
Module name	Soil and plant science
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Bridging module for students lacking basic knowledge in some agronomy disciplines. With the help of lectures and reading materials students will be enabled to fill in gaps and get updated on state-of-the art knowledge with a special focus on questions pertinent to organic agriculture. Students, having taken this module, will be able to follow advanced courses in the above fields.
Course types	Lecture 60h
Content	Influence of soil formation processes on physical properties (texture, soil water, pore space), chemical properties (buffering, exchange capacity, nutrients), and biological properties (organic matter, edaphon), soil formation and classification. Nutrient availability and nutrient mobilization under conventional and organic agricultural conditions. Major and minor nutrients and food quality. Plant breeding goals for different agricultural systems. Plant morphology, genetics and breeding: principles of plant domestication and use, characterization and evaluation, use of genetic resources in plant breeding, genetic basis for plant breeding Genetics of host-parasite interactions, epidemiology and plant defense. Insect physiology, ecology.

Title of courses	Soil and plant science
Teaching and learning methods	Lecture
Usability in other programs	Bridging module according to §9(5) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Written test (120min) or Oral test (20min)
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw.u.Ök.Landwirtschaft
Responsible person	Dr. H. Saucke
Lecturer(s)	Dr. H. Saucke, Prof. Dr. A. Bürkert, Prof. Dr. G. Backes
Media used	diverse
Recommended literature	Brady N.C. 1990: The nature and properties of soils. 10th edition, Prentice Hall; Marschner H. 1995: Mineral Nutrition of Higher Plants, Academic Press, New York; Sanchez P. 1976: Properties and Management of Soils of the Tropics, Wiley, New York; van Wyk B.E. 2005: Food Plants of the World. Compulsory elective modules I: Agriculture and Ecology

Unconventional livestock and wildlife

Module number / code	A07
Module name	Unconventional livestock and wildlife
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Based on the historical development of agriculture, particularly the domestication of animals, students know the differences between livestock and wildlife and the importance and potential of unconventional livestock and wildlife for rural development and human livelihoods in different regions of the world. Students obtain an overview over the wide variety of unconventional livestock, their adaptive features, biology and ecology and the various production systems under which they are kept. Students familiarize with the variety of wildlife species, their biology, ecology, and population dynamics and the potential of their exploitation. They know the major international conventions pertaining to wildlife conservation and are familiar with the nature and magnitude of human/wildlife conflicts. They know about costs and benefits associated with human-wildlife-co-existence and understand the dilemma between (inter)national conservation objectives and local household livelihood objectives. Students obtain an overview over different terminal and non-terminal options of wildlife utilization and management and their respective potential contribution to the above conflicting objectives.
Course types	Seminar 40h, Exkursion 20h
Content	History of domestication of livestock. Unconventional livestock in Asia/Oceania, Africa and Latin America: Biology, management and, production systems. Commercial and subsistence products from little known domesticated animal species – such as insects, snails, reptiles, rodents, up to little-used ungulates. Local and national economic potential and contribution to local livelihoods. Wildlife in Asia, Africa and Latin America: Biology, wildlife population dynamics, human/wildlife conflicts, international conventions on (agro)-biodiversity and conservation, strategies for wildlife conservation through utilisation, different wildlife utilisation concepts, wildlife-based tourism, terminal wildlife utilization of different intensity ("Hunting/Trophy hunting", "Game-Ranching", "Game Farming", "Feedlot" with beginning domestication), community-based utilisation cum conservation approaches. Contribution of wildlife utilisation to the livelihood of rural communities. Regulations, possibilities and constraints for wildlife conservation.
Title of courses	Unconventional livestock and wildlife
Teaching and learning methods	Lecture, seminar, excursion
Usability in other programs	Compulsory elective module according to §9 (7) Examination Regulations Master AGES
Duration	1 Semester, biennial
Frequency of module offer	annually in summer semester

Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge of soil, plant and animal sciences
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral presentation (appr. 20min) Grade weighting P1: 30% Examination P2: Written test (90min) Grade weighting P2: 70%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw.u.Ök.Landwirtschaft
Responsible person	Dr. C. Hülsebusch
Lecturer(s)	Dr. C. Hülsebusch
Media used	diverse

Social-ecology in livestock production systems

Module number / code	A08
Module name	Social-ecology in livestock production systems
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students understand livestock farming systems as social-ecological systems in which livestock farmers, through their actions, establish, maintain and develop the respective production system. Consequently, these so-called human activity systems are assessed using an actor-oriented approach. Emphasis of this module is on methods that are used to analyse and improve farmers' management. This serves to understand "why farmers do what they do" and "how farmers produce". Students learn how they can make use of the knowledge of farmers to a) better understand how low external input systems function and b) co-develop innovations that fit to contextual conditions. Collaborative learning is introduced as methodology to operationalise transdisciplinary research and

	deals with the question of how mutual understanding between farmers and scientists can be achieved despite the different knowledge systems. Students obtain a profound insight into methods for stakeholder and gender analysis, knowledge integration and knowledge co-creation Participatory monitoring is introduced as method to learn from application of the co-developed innovations.
Course types	Seminar 60h
Content	Theoretical background of the social-ecological system view: System theory, 1st and 2nd order cybernetics, complex problematic situations, human activity systems. Actor-oriented approach to understand and influence low external input systems: Local knowledge and situated practices Methodology for understanding local knowledge: Second order observation and knowledge analysis Collaborative learning: Exchange between knowledge systems, dialogue, action research, livestock farmer experimentation, participatory monitoring and evaluation
Title of courses	Social-ecology in livestock production systems
Teaching and learning methods	Seminar
Usability in other programs	Compulsory elective module according to §9 (8) Examination Regulations Master AGES
Duration	1 Semester, bienniel
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge of soil, plant and animal sciences
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Written test (90min) Grade weighting P1: 70% Examination P2: Oral presentation (appr. 20min) Grade weighting P2: 30%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	apl Prof. Dr. B. Kaufmann
Lecturer(s)	apl Prof. Dr. B. Kaufmann

Media used	Will be announced in the module

Livestock nutrition and feed evaluation under (sub)tropical conditions

Module number / code	A10M
Module name	Livestock nutrition and feed evaluation under (sub)tropical conditions
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students are able to:</p> <ul style="list-style-type: none"> • describe the function of the major digestive systems and processes of domestic livestock species and their consequences for ration formulation • understand the different feeding strategies and nutritional requirements of the main livestock species • assess the quality of feedstuffs through theoretical concepts and practical feed quality analyses • calculate rations for the main livestock species • understand abiotic and biotic environmental influences on the physiology of different livestock species • discuss opportunities and limitations of feeding strategies for an optimization of livestock production under specific agro-ecological settings
Course types	Lectures 36h, lab practical 20h
Content	<p>Livestock nutrition and feed science: The lecture explains and discusses the nutritional physiology of the globally most important livestock species. The adaptation of the different livestock species to climatic conditions and to qualitatively and quantitatively variable fodder supply is analysed. Possibilities to reduce the negative impact of environmental factors on animal production through adapted feeding strategies and ration formulation are evaluated.</p> <p>Laboratory analyses of feedstuffs: Students are introduced to the main standard methods of feed quality analyses, such as determination of crude protein, macro-minerals, cell wall constituents and tannin content. They apply these methods onto selected tropical feed samples and write an essay on one or more methods, thereby interpreting the related quality of their feed samples.</p>

Title of courses	Livestock nutrition and feed evaluation under (sub)tropical conditions
Teaching and learning methods	In-class lectures, online self-study materials, hands-on lab-practical
Usability in other programs	Compulsory elective module according to §9 (7) Examination Regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge of animal sciences
Required prerequisites for participation	-
Student workload	180 hours, of which 56 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral exam (appr. 20min) Grade weighting P1: 75% Examination P2: Lab protocol (max. 3.000 words) Grade weighting P2: 25%
Credit points (ECTS)	6 cp

Livestock-based sustainable land use

Module number / code	A13M
Module name	Livestock-based sustainable land use
Type of module	Elective module
Learning outcomes, acquired	To understand the interactions of livestock with the natural resource base and their site- and management specific positive or negative environmental impacts; To get acquainted with and test methodological approaches used

competencies and qualification goals	in field research on livestock-environment interactions; To learn about simple modelling approaches and the significance of their results.
Course types	Lectures 40h, field exercises 16h
Content	<p>This module highlights the general positive and negative impacts of livestock and livestock management on the natural resources (air, water, soil, vegetation), specifically under (sub)tropical conditions, at the plot to the watershed scale. It discusses options for sustainable livestock-based land use, thereby building upon the beneficial impacts of animals on soils and plants. Management options for reducing negative environmental effects of livestock (greenhouse gas emissions, nutrient excretion) are highlighted, and possibilities for consolidating the interests of livestock keepers with international conventions of environmental protection are discussed.</p> <p>Through classical lectures, own reading, and practical field exercises, the students are introduced to up-to-date quantitative and qualitative methods that are used in studies on animal-environment interactions.</p> <p>Simple modelling approaches that depict animal-environment interactions at the plot level up to the watershed scale are presented and tested by the participants.</p>
Title of courses	Livestock-based sustainable land use
Teaching and learning methods	Lectures, online self-study materials, hands-on field exercises
Usability in other programs	Compulsory elective module according to §9 (7) Examination Regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge of soil, plant and animal sciences
Required prerequisites for participation	-
Student workload	180h, of which 56 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Written test (90min)
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. E. Schlecht
Lecturer(s)	Prof. Dr. E. Schlecht

Media used	Classical lectures, videos, articles
Recommended literature	Steinfeld H., Gerber P., Wassenaar T., Castel V., Rosales M., de Haan C. 2006: Livestock's long shadow. FAO, Rome, Italy; Specific scientific articles, distributed in the course.

Digitalization in livestock systems

Module number / code	A17
Module name	Digitalization in livestock systems
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<ul style="list-style-type: none"> • Have an overview of the current trends in digital technology for agricultural development with particular emphasis on livestock husbandry. • Be familiar with key terminologies including Precision Agriculture (PA), Precision Livestock Farming (PLF), Precision Pasture Management (PPM), and Digital Livestock Farming (DLF). They should be able to give relevant examples of a range of technologies currently applied to facilitate individual animal management systems. • Identify the opportunities and challenges of PLF for organic agriculture • Be able to critically assess the benefits of digitalisation vis-à-vis the socioeconomic realities of agricultural transformation, especially in low- and middle-income countries • Develop scientific presentation and reporting skills
Course types	Vorlesung 16h, Seminar 44h
Content	<p>Digitalisation is revolutionising the agricultural sector at an unprecedented pace requiring the building of human resource capacity to conveniently cope with the emerging norms of farming and livestock husbandry practices. In this module, students will be given a broader overview of the changes that have taken place in agricultural development. The concept of digital transformation which is enforcing the adoption of automation, high-tech sensors, cloud computing, decision making algorithms, and the Internet of Things will be introduced, and terminologies such as PA and PLF will be explained. Focusing on PLF, students will be helped to self-study a range of digital tools currently in use for either individual or group intensive and extensive management systems. These may include but not limited to the following:</p> <ul style="list-style-type: none"> • Use of radio frequency identification (RFID) leveraged in other technologies for monitoring feed intake, weight gain etc. • Behavioural monitoring using on-animal motion and pressure sensors • Thermal and biochemical sensors for monitoring disease state • Autonomous animal location management (virtual fencing) • Pasture management using geographical information system (GIS)

	<p>The students must have a fair understanding of what these tools/systems are, their mode of operation, associated costs, and the pros and cons of usage.</p> <p>As part of the learning process, students will be provided with journal article(s) relevant to the trends in application of digitalisation in PLF. Each student would be required to carefully study/review the article provided, and prepare a 25-page (max.) PowerPoint presentation to be presented in a weekly seminar session. Non-presenting students are also required to attend the weekly seminars and learn from their colleagues.</p>
Title of courses	Digitalization in livestock systems
Teaching and learning methods	Vorlesung, Seminar
Usability in other programs	Compulsory elective module according to § 9 (7) Examination Regulations Master AGES

Grassland-based livestock systems and climate change mitigation

Module number / code	A18
Module name	Grassland-based livestock systems and climate change mitigation
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Grassland-based livestock systems has the following objectives: (i) to learn fundamental relationships between livestock management and forage value of grasslands; (ii) to learn about factors affecting animal performance and animal health; (iii) to become familiar with scientific approaches in animal science and grassland-based systems.</p> <p>Climate change mitigation: (i) understand the basics of greenhouse gas (GHG) emissions and climate change related to livestock; (ii) become familiar with key international climate conventions and agreements; (iii) get acquainted with the methodological approaches used for collecting data and calculating GHG emission from grassland-based livestock systems; (iv) become familiar with policies and mitigation measures for decreasing emissions in these systems.</p>
Course types	Vorlesung 30h, Seminar 30h
Content	<p>Grassland-based livestock systems: Grasslands play a vital role for biodiversity and the climate. Grazing on grasslands has a long tradition in livestock farming and production of high-quality animal products. Today's generations of livestock farmers face increasing challenges because of climate change, invasive plant species, modern animal genetics with high energy and nutrient requirements, and other factors. This sub-module will focus on these challenges from a farmer and animal perspective, looking at various grassland management practices that promote biodiversity and ensure animal health and the production of high-quality livestock products. Participants will learn to differentiate between feed qualities and recognize their effects on animal performance and product quality. Lectures will provide knowledge about selective plants and plant biodiversity in relation to animal health and product quality. The effects of grazing on forage quality and vice versa will be discussed and additional factors such as climate change and plant diversity will be considered.</p> <p>Climate change mitigation: Reducing GHG emissions is paramount to combat climate change globally. Grassland-based livestock systems contribute to climate change but are also affected by it, which means that livestock in these systems can be part of the solution. This sub-module is designed to provide participants with an introduction to the topic of GHG emissions from livestock in grassland-based systems. Key international climate conventions (e.g., the Paris Agreement) and other international commitments envisaged to combat climate change will be discussed. We will explore both qualitative and quantitative aspects needed for understanding, quantifying and mitigating GHG emissions from grassland-based livestock systems. The sub-module will also present different policies and measures (e.g., carbon credits and tax incentives) that can be considered to support a decrease in GHG emissions from livestock in grassland-based systems.</p> <p>The lectures for each sub-module are given by researchers from FB11 at Uni Kassel and invited speakers. In the seminar part, students give a presentation on a topic from this course. Guest lecturers from international</p>

	research institutions and the private sector will be invited for both sub-modules.
Title of courses	Grassland-based livestock systems and climate change mitigation
Teaching and learning methods	Vorlesung, Seminar

Innovative sustainable breeding

Module number / code	A19
Module name	Innovative sustainable breeding
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students</p> <ul style="list-style-type: none"> • understand the complex challenges facing global livestock production, including societal expectations, environmental sustainability, and efficient resource management. • are able to explore and critically evaluate innovative breeding strategies that contribute to sustainable agricultural practices. • gain practical insights into strategic breeding through interactive learning methods such as lectures, seminars, group discussions, and field trips (if feasible). • design a sustainable livestock breeding program that addresses real-world issues, demonstrating an ability to integrate economic viability with social acceptability, animal welfare and environmental health. • contribute meaningfully to policy discussions or practical interventions aimed at promoting sustainability within the livestock sector.
Course types	Vorlesung 30h, Seminar 30h
Content	<p>In recent years, the paradigm has shifted from prioritizing animal productivity to embracing a more holistic approach in livestock breeding programs that includes animal health, environmental impact, and resource efficiency alongside with economic and production aspects. This course aims to provide students with a comprehensive understanding of these changes and to explore breeding strategies that align with contemporary societal values and international best practices.</p> <p>Students will engage with topics including:</p> <ul style="list-style-type: none"> • Societal expectations and livestock production: Understanding how consumer preferences and societal norms are reshaping livestock breeding objectives. • Sustainable breeding practices: Exploring strategies that balance productivity with animal health, environmental sustainability, and resource efficiency. • Genetic diversity management: Examining the importance of preserving breed diversity as a cultural heritage and as an investment in future resilience to stresses such as zoonotic disease outbreaks and global warming. • Ethical breeding approaches: Investigating ethical considerations in breeding practices that respect animal welfare while meeting farmers' production goals and societal norms.

	<ul style="list-style-type: none"> Policy implications: Assessing the role of policy in guiding sustainable breeding practices and protecting genetic diversity <p>Students will develop skills to critically analyze and synthesize literature related to livestock breeding challenges and opportunities, elaborate exemplary breeding approaches for diverse environmental and societal goals, learn to effectively communicate scientific research findings and propose solutions to stakeholders.</p>

Management of (sub-)tropical landuse systems

Module number / code	I02
Module name	Management of (sub-)tropical landuse systems
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Enable students to understand the functioning and bio-physical limitations of (subtropical agro-pastoral land use systems, to argue for the need of interdisciplinary approaches to overcome these and to apply current research methods in land use systems analysis.
Course types	Lecture 42h with integrated exercises 6h and student seminars (20%)
Content	Teachers from Witzenhausen: Plant-animal interactions, diet selection and nutritional wisdom, impact of grazing on pastures; statistical approaches to measure and cope with short-distance variability in crop growth; measurement techniques for nutrient fluxes in different agroecosystems. Teachers from Prague: Land-use management: farm and family income in different farming systems, soil conservation technologies for smallholder farming systems, conservation tillage systems, potential use of waste-stream products to enhance soil productivity in tropical peri-urban and rural areas, crop diversity in tropical agricultural systems.
Title of courses	Management of (sub-)tropical landuse systems
Teaching and learning methods	Lecture, exercises, seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination Regulations Master AGES, participation limited to 5 students from AGES
Duration	1 Semester, biennial
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Knowledge in plant, soil and animal sciences
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Written test (90min)
Credit points (ECTS)	6 cp

Applied statistical modelling

Module number / code	I10M
Module name	Applied statistical modelling
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students have a detailed understanding of the concepts of statistical modelling, regression analyses and analyses of variance. They are familiar with the basic concepts of linear models and non-parametric estimation procedures, which now belong to the standard methods in applied statistics. Students are able to practically apply these methods and carry out statistical analyses in soil, plant and animal sciences using the statistical software R. They are able to apply the acquired skills in the analysis of their own MSc (and PhD) datasets.
Course types	Seminar 60h
Content	<ul style="list-style-type: none"> • Review of statistical concepts (boxplots, QQ plots, distributions, classical tests, correlations, analyses of count and proportion data) • General aspects of hypotheses formulation and testing • Basic concepts of experimental design • Standard experimental field designs • Introduction to the software R • Regression (multiple linear, non-linear and logistic) • Statistical modelling, model types and model simplifications • Transformations • Analyses of variance, post-hoc tests • Non-parametric test procedures • Analysis of covariance • Particularities of unbalanced designs • Formulation of statistical models and basic programming in R • Linear mixed models
Title of courses	Applied statistical modelling
Teaching and learning methods	Seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination Regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in summer semester

GIS and remote sensing in agriculture

Module number / code	I14M
Module name	GIS and remote sensing in agriculture
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p><i>GIS:</i> A broad overview of basic GIS functions and related background knowledge should enable students to explore GIS-Software for relevant commands and prepare functional strategies for spatial data management and analysis. Lecture and exercise examples have predominantly agricultural reference.</p> <p><i>Remote Sensing:</i> The lecture will introduce physical principles (reflectance, transmittance, and absorption), sensor techniques (passive and active sensors, satellites, field spectrometer) and methods of analysis (calibration, validation) in remote sensing applications. This technical framework is presented using agricultural examples, as e.g. the generation</p>

	of maps for crop yield and protein, assessment of species composition in mixed vegetation (e.g. grassland), like legume content for a calculation of residual nitrogen and crop rotation effects.
Course types	Seminar 60h
Content	<p><i>GIS:</i> The course gives an introduction to Geographical Information Systems (GIS). Starting from geodetical background information, a wide range of different GIS- methods and -functions are presented using agricultural examples (e.g. data import, georeferencing, aggregation, (re)classification, interpolation, overlays and image analysis). The students have the opportunity to carry out exercises on the computer themselves for some important GIS-procedures. A special focus is given on data capturing using maps and field data survey with GPS as well as the spatial analysis of site conditions. Finally a particular view on GIS in organic farm management and Precision Farming is given.</p> <p><i>Remote sensing in agriculture:</i> The lecture will introduce physical principles (reflectance, transmittance, and absorption), sensor techniques (passive and active sensors, satellites, field spectrometer) and methods of analysis (calibration, validation) in remote sensing applications. This technical framework is presented using agricultural examples, as e.g. the generation of maps for crop yield and protein, assessment of species composition in mixed vegetation (e.g. grassland), like legume content for a calculation of residual nitrogen and crop rotation effects.</p>

Sustainable diets

Module number / code	I17
Module name	Sustainable diets
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students are able to</p> <ul style="list-style-type: none"> • Evaluate food quality using the criteria of sustainability, • describe nutrition in the context of human health and sustainable development, • describe the impact of a meal/food on nutrition and the environment using concrete indicators, • develop a strategy to optimize a meal/food in terms of sustainability, • name and apply measurement tools to assess sustainability in nutrition, • work and present in groups.
Course types	Seminar 60h
Content	<ul style="list-style-type: none"> • Culture and cultural patterns of diets • Interactions of food quality and lifestyle on sustainability and human health • Healthy diets within sustainable food systems • Model diets such as Med. Diet and New Nordic Diet • Optimization of a dish/meal according sustainability and nutrition impacts • Role of organic food systems
Title of courses	Sustainable diets
Teaching and learning methods	Seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge on nutrition, statistics and environmental issues.

Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours

Participatory research methods for sustainability

Module number / code	I19M
Module name	Participatory research methods for sustainability
Type of module	Elective module

Learning outcomes, acquired competencies and qualification goals	<p>This course will look at the importance of place-based, participatory and transdisciplinary research methods in sustainability science. Students will learn different participatory methods to capture the knowledge and aspirations of the different agents that operate in agricultural landscapes and will be able to integrate this knowledge in practical outcomes for sustainable land management.</p> <p>After successfully completing this module students should:</p> <ul style="list-style-type: none"> • comprehend the fundamentals of participatory research • be familiar with the different types of participatory research methods • be able to design and implement participatory processes <p>This module contributes to the following skills:</p> <ul style="list-style-type: none"> • performance of transdisciplinary processes • integration of knowledge and aspirations of different agents towards sustainable land management • data collection and analysis using participatory methods • group work techniques (organization of working schedule, team work) • presentation skills and communication of main research results
Course types	Lecture 30h, seminar 30h
Content	<p>The course is structured in three parts. An introductory part focuses on research principles of sustainability science, paying particular attention to the role of transdisciplinarity and ethics in the participation processes.</p> <p>A second part showcases a broad suite of different participatory research methods (e.g. photo-voice, participatory mapping, storytelling) for sustainable landscapes management and land-use conflict resolution. The full research process is addressed, from participatory process design, the approaching and involvement of participants and the organisation and facilitation of participatory activities, to the analysis, integration and presentation of the outcomes.</p> <p>In the third part of the course, students have the opportunity to choose and design a protocol for a participatory study, applied to a specific geographical location and a specific problem, and share the insights of the process with the class. The first part will be outlined in lectures, the second part will take the form of seminars and the third part will consist of group work with a final presentation to the class where the different experiences will be critically discussed.</p>
Title of courses	Participatory research methods for sustainability
Teaching and learning methods	Lecture, seminar
Usability in other programs	Compulsory elective module according to §9(8) Examination Regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch

Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral presentation (appr. 30min) Grade weighting P1: 50% Examination P2: Written report (appr. 8.000 words) Grade weighting P2: 50%
Credit points (ECTS)	6 cp

Modelling climate impacts on agroecosystems

Module number / code	I24
Module name	Modelling climate impacts on agroecosystems
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	The students have an overview of models used to capture climate change impacts on different agroecosystems and the effects of climate adaptation measures. The module teaches climate change impacts on various agroecosystems, adaptation measures and how these aspects can be captured by different types of statistical and process-based agricultural models. With this knowledge, the students are able understand and develop agricultural models to assess climate impacts, risks and resilience. In the last section, adaptation measures to climate change are modeled, discussed and evaluated using various methods and indicators.
Course types	Seminar 60h
Content	The course gives an overview of climate change impacts across different agroecosystems, a solid understanding of climate and agricultural models and the projected climate impacts on the agricultural production, resilience and adaptation. In addition, short term climate and weather risks are discussed in the course. The lecture

	is in parallel with an exercise, where the students rebuild and develop own models in the statistic software R.
Title of courses	Modelling climate impacts on agroecosystems
Teaching and learning methods	Lecture, seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	First experience with the statistic software R is valuable.
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral examination (appr. 30min) Grade weighting P1: 50% Examination P2: Written report (max. 7.500 words) Grade weighting P2: 50%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. C. Gornott
Lecturer(s)	Prof. Dr. C. Gornott

Organic agriculture in Europe

Module number / code	I30
Module name	Organic agriculture in Europe
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students understand the situation of organic agriculture in different European countries. Students are able to discuss and judge standards of organic agriculture.
Course types	Seminar 60h
Content	<ul style="list-style-type: none"> • Comparison of standards of organic agriculture (IFOAM, EU, within EU). • Situation of organic production, processing and markets in different European countries. • Organic agriculture in European Universities: current research projects, teaching activities. • Necessary measures on all levels in the coming future to transform agriculture production in different countries to organic agriculture.
Title of courses	Organic agriculture in Europe
Teaching and learning methods	Online lectures, discussions, group work
Usability in other programs	Compulsory elective module according to §9(7) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, within 40h contact hours
Required course work	
Prerequisites for examination(s)	

Module examination(s)	Examination P1: Individual written report (appr. 15 p.) or group student presentation and individual report (appr. 25min, 10 p.) Grade weighting P1: 80% Examination P2: Oral examination (15min) Grade weighting P2: 20%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft

Sustainable land-use and climate mitigation

Module number / code	I31
Module name	Sustainable land-use and climate mitigation
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Upon successful completion of the module students</p> <ul style="list-style-type: none"> • will be able to understand key scientific concepts around climate change and its mitigation. • have deep knowledge on land-based mitigation options, their potentials, interplays and side-effects • will understand the scientific principles of the interplay between climate mitigation and other sustainable development targets • will be able to develop interdisciplinary and holistic viewpoints on sustainable land management including land-based mitigation • will obtain an overview of models used to assess mitigation pathways • will be able to understand land-use models and Integrated Assessment Models that are used to derive future pathways • will become familiar with international assessment bodies such as IPCC or IPBES • develop critical thinking of the scenarios used in international assessments such as IPCC and IPBES • will explore analytical tools such as scenario explorers and land-use models • will reflect on the concepts of the course throughout seminar presentations and discussions
Course types	Vorlesung 15h, Seminar 15h, Exkursion 30h

Content	<p>Land-based climate mitigation measures have gained significant attention and importance in public and private sector climate policies.</p> <p>To start with, this course provides an overview on climate change and its mitigation in general, focusing on the land-use sector. It will highlight the contributions of land use to as well as its potentials for mitigating climate change. Hereby, the course will help to increase the understanding of the needs, opportunities, potentials, interplays of different land-based mitigation options as well as their interaction with other sustainable development targets such as biodiversity protection. The course continues introducing international assessment bodies such as IPCC and IPBES being one of the major scientific basis of public and private sector decision making. Moreover, the scenarios as well as the tools applied for developing these scenarios will be assessed and discussed. Students then work on selected current topics of Land-Based Climate Mitigation from different perspectives which are accompanied by the lecturers. At the end of the semester, all students present their outcomes.</p> <p>Part of the module will take place at the Potsdam Institute of Climate change.</p>
Title of courses	Sustainable land-use and climate mitigation

Biodynamic agriculture

Module number / code	I32
Module name	Biodynamic agriculture
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Learn to know basic principles of biodynamic agriculture (in Germany and worldwide), critical discussion of practical examples and scientific studies on the topic, as well as insight into practice on a biodynamic farm and into research work on the issue.
Course types	Seminar 45h, Exkursion 15h
Content	Introduction to the basics of biodynamic agriculture with practical examples from Germany and around the world. The areas of animal husbandry, plant breeding and product quality as well as the underlying principles of biodynamic agriculture will be discussed. With a focus also on scientific studies on the subject and current concepts like one health. The course includes a 3-day excursion to a biodynamic farm and a research institution.
Title of courses	Biodynamic agriculture
Teaching and learning methods	Seminar, Exkursion
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES
Duration	1 Semester, jährlich
Frequency of module offer	annually in summer semester
Teaching language	Englisch

Recommended (knowledge) prerequisites	-

Food processing

Module number / code	I33
Module name	Food processing
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students can: <ul style="list-style-type: none"> • Describe the basic processes and systems of food processing • Derive quality-relevant steps, raw material and product properties • Discuss the differences between industrial and artisanal production • Classify the production of food in the wider context of sustainable development
Course types	Vorlesung 45h, Seminar 15h
Content	General definitions of food quality, special emphasize on organic food quality, Sensory evaluation techniques in quality assessment, general methods of food analysis Practical Part: Examples of Sensory and analytical Quality assessment.

Title of courses	Food processing
Teaching and learning methods	Vorlesung, Seminar
Usability in other programs	Bridging module according to §7 (3) Examination Regulations Master IFBC Mandatory module according to §10 (7) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basics in chemistry
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work

Ecology and agroecosystems

Module number / code	P01
Module name	Ecology and agroecosystems
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students are able to define site-specific conditions of sustainability, identify key constraints to the productivity and sustainable use of agroecosystems, assess the scope of human (management) interventions, determine the causes of productivity decline and chose approaches to strengthen sustainability
Course types	Vorlesung 50h, Seminar 10h
Content	Case-study based analysis and discussion of ecological framework conditions (limitations) in different arid and sub-humid agroecosystems of tropical and temperate zones with a particular focus on marginal soils and/or difficult infrastructural conditions where effective nutrient cycling, integration of cropping and animal husbandry systems

	as well as the use of biodiversity for income generation at the farm level is of particular importance. The potential/role of organic agriculture will be discussed and a more general discussion of the potential of organic agriculture to strengthen the resilience of agroecosystems will be presented.
Title of courses	Ecology and agroecosystems
Teaching and learning methods	Vorlesung, Seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge in plant, soil and animal science, willingness to analyse agro-ecosystems quantitatively
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Written test (90min) Grade weighting P1: 70% Examination P2: Oral presentation (appr. 25min) Grade weighting P2: 30%
Credit points (ECTS)	6 cp

Recommended literature	Altieri, M. 1987: Agroecology: the scientific basis of alternative agriculture. Westview Press, Boulder, Colorado, USA; Gliessman, S.R. 1998: Agroecology: ecological processes in sustainable agriculture. Ann Arbor Press, Michigan, USA.

Organic cropping systems under temperate and (sub)tropical conditions

Module number / code	P05
Module name	Organic cropping systems under temperate and (sub)tropical conditions
Type of module	Elective module

Learning outcomes, acquired competencies and qualification goals	Students are able to describe the principles and functions of agro-ecosystems, understand nutrient cycles and options for their improvement as an important basis of organic farming, evaluate systems of land use with a particular focus on organic modes of production and their role in agro-ecosystems, assess the role of livestock for nutrient cycling and with respect to the conservation of plant and animal biodiversity in (sub)tropical settings.
Course types	Lecture 40h, Excursion 10h, Seminar 10h
Content	Visits of organic farms; History of organic farming, current developments; development, evaluation and comparison of land use management systems under diverse natural, economic and socio-cultural conditions; nutrient cycling in plant-animal systems; site-specific contributions of legumes to N supply; P availability, P recycling and use of rock phosphates; modes of P supply in farming systems; EC, Australian, Japanese and North American regulations for organic farming – problems and opportunities.
Title of courses	Organic cropping systems under temperate and (sub)tropical conditions
Teaching and learning methods	Lecture, excursion, seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180 hours, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral Examination (15 min) Grade weighting P1: 70% Examination P2: Oral presentation with outlet (appr. 20min, 10 p.) Grade weighting P2: 30%

Agrobiodiversity and plant genetic resources in the tropics

Module number / code	P13
Module name	Agrobiodiversity and plant genetic resources in the tropics
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students are able to understand the role of agrobiodiversity in tropical agro-ecosystems, to present approaches of functional biodiversity analysis and to discuss the needs and strategies of on-farm (in situ) and off-farm conservation of plant genetic resources.
Course types	Seminar 60h
Content	Case-study based analysis of the role of biodiversity for selected crops in different agro-ecosystems from the arid to the humid climate zones; importance of biodiversity for the stability / sustainability of smallholder (subsistence) versus commodity-oriented commercial agriculture in the Tropics, assessment and utilization of diversity, principles and practices in conservation of genetic resources, role of homegardens and indigenous wild fruit trees for in situ conservation of biodiversity, causes and consequences of genetic erosion, approaches of germplasm collection.
Title of courses	Agrobiodiversity and plant genetic resources in the tropics
Teaching and learning methods	Seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Basic knowledge in plant and soil sciences
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral test (15 min) Grade weighting P1: 60%

	Examination P2: Oral presentation (appr. 20min) Grade weighting P2: 40%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw.u.Ök.Landwirtschaft

Nutrient dynamics, experimental design and statistical modelling - bilingual

Module number / code	P27M
Module name	Nutrient dynamics, experimental design and statistical modelling - bilingual
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students understand the advantages and disadvantages of different experimental designs in agricultural experiments. For each design, they are able to carry out correct data analyses using combined regression and analysis of variance or linear mixed effects models in R. Based on their understanding of soil nutrient dynamics and experimental designs they are able to evaluate and critically assess the significance of field and laboratory experiments for studying C, N and P dynamics and to consider all influencing variables.
Course types	Lecture 40h, exercises 20h
Content	<ul style="list-style-type: none"> • Description of the dynamics of C, N and P (forms, transformations and availability) in arable soils • Experimental designs in agricultural experiments: completely randomized design, randomized complete block design, Latin square design, split-plot design and balanced incomplete block design • Statistical modelling: combined regression and analysis of variance and linear mixed effects models • Modelling of the turnover of soil organic matter using the SoilR package in R • Application of the statistical software R for a description of C and N dynamics
Title of courses	Nutrient dynamics, experimental design and statistical modelling - bilingual
Teaching and learning methods	Lecture, exercises
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES; Method module

Duration	1 Semester

Digitalization in agriculture

Module number / code	P28
Module name	Digitalization in agriculture
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	The participants will have gained a holistic understanding of the machine vision, image processing and machine learning, data classification and pattern recognising and prediction methodologies around agricultural and animal farming stuffs.
Course types	Lectures 20 h, seminar/practical 35 h, field exercise 5 h
Content	<i>Machine vision and image processing</i> <ul style="list-style-type: none"> • Introduction to digital images in agricultural science

	<ul style="list-style-type: none"> • Application and principle of optical and infrared technology for monitoring of agricultural and animal products • Machine vision and image processing in agricultural context • Developing image processing algorithms in MATLAB® software <p><i>Machine learning and data processing</i></p> <ul style="list-style-type: none"> • Basic techniques and functions of matrices in MATLAB® • Computer programming in MATLAB® • Development of machine learning algorithms • Training, validation and test set selection in machine learning models • Pattern recognition and object detections algorithms • Development of data classification and pattern forecasting models in agricultural and livestock farming datasets • Introduction to deep learning and artificial intelligence in agriculture
Title of courses	Digitalization in agriculture
Teaching and learning methods	Lectures, seminar, practical, field exercise

Biochar for Environmental Management

Module number / code	P31
Module name	Biochar for Environmental Management
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>The students obtain basic knowledge in the areas of the production of biochar and activated carbon from residual biomass, as well as their use in agricultural and environmental applications. They develop a deeper understanding of pyrolytic processes and procedures, as well as different technological conversion processes for the production of biochar and activated carbon from biomass. They understand relationships between biomass composition, physico-chemical characteristics of biochar and activated carbons, and their potential applications.</p> <p>The students develop the ability to evaluate thermo-chemical conversion processes of biomasses, as well as to identify relevant influencing parameters on the quality and possible applications of biochar and activated carbon.</p> <p>The students have basic knowledge regarding the advantages and limitations of a material and energetic utilization of residual biomasses to produce biochar and activated carbon, as well as their use in the agricultural and environmental sector for a sustainable environmental and resource management.</p>
Course types	Vorlesung 20h, Seminar 20h, Übungen 20h
Content	<p>Theoretical basics of thermo-chemical conversion (pyrolysis) of biomasses to produce biochar, with a focus on the use of (agricultural) residual biomasses for sustainable resource use, as well as the production of biogenic activated carbons for the substitution of fossil activated carbons in environmental applications. Fundamentals of possible treatment processes of grass and herbaceous residual biomasses for pyrolytic utilization. Possible uses of biochar and activated carbon in agricultural and environmental applications. Material and energetic balances of thermo-chemical processes. Requirements for purity and quality of biochar and activated carbon for different fields of application.</p> <p>Production of biochar and activated carbon from residual biomass (incl. treatment) on laboratory scale using different processes.</p> <p>Laboratory work for basic analytical characterization of the produced biochar and activated carbon and evaluation of their performance for environmental management.</p>
Title of courses	Biochar for Environmental Management
Teaching and learning methods	Lecture, laboratory work, seminar

Soil-plant interactions

Module number / code	P32M
Module name	Soil-plant interactions
Type of module	Elective module

Learning outcomes, acquired competencies and qualification goals	Students will conduct a small research project related to an agricultural topic and learn the relevant involved steps of the process.
Course types	Lecture 8h, Seminar 8h, Excursion 4h, Laboratory 40h
Content	<p>Introduction to and application of relevant up-to-date methods in plant-soil interactions in response to abiotic stress. The complete operational sequence of a research project is simulated:</p> <ul style="list-style-type: none"> • sampling • sample preparation, • measurements and data collection (application of methods) • data processing • statistics and • drafting a manuscript <p>Up-to-date literature is presented and discussed by the students.</p>
Title of courses	Soil-plant interactions
Teaching and learning methods	Lecture, Seminar, Excursion, Laboratory work
Usability in other programs	Mandatory module according to §9 (7) Examination Regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	<p>Examination P1: Work report (app. 15 p) Grade weighting P1: 50% Examination P2: Project presentation (appr. 20min) Grade weighting P2: 50%</p>
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Prof. Dr. J. Simon
Lecturer(s)	Prof. Dr. J. Simon and staff
Media used	verschiedene
Recommended literature	<p>Parker R. 2009: Plant & Soil Science: Fundamentals & Applications (Editor: Delmar)</p> <p>Literature will be provided in the framework of the course</p>

Water in the soil plant-system

Module number / code	P33M
Module name	Water in the soil plant-system
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students will be able to understand and model energy, water and nutrient flows in the soil-plant-atmosphere system. The main focus is on methods for working with models.
Course types	Vorlesung 30h, Übungen 30h
Content	<p>The course focuses on the basic methods for working with process models. physical processes in the soil-plant-atmosphere system. The course consists of roughly equal parts lecture content and computer-based exercises.</p> <p>In the lecture part, the most important concepts for modeling the relevant soil and plant growth processes are explained, and in a second part, a detailed introduction to the agroecosystem simulation model Expert-N is given.</p> <p>Computer exercises are carried out in which students perform simulations on the following topics:</p> <ul style="list-style-type: none"> • Water flow in agroecosystems • Water extraction and distribution, surface irrigation, sprinkler irrigation, drip irrigation • Carbon and nitrogen turnover in soils • Climate change and crop production
Title of courses	Water in the soil plant-system
Teaching and learning methods	Lectures, exercises
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES; Method module
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	S1: Presence in the exercises
Prerequisites for examination(s)	
Module examination(s)	Oral test (30min)

Nutrient acquisition by plants

Module number / code	P34
Module name	Nutrient acquisition by plants
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students obtain a more detailed knowledge on how nutrients, especially nitrogen and phosphorus, are acquired by plants.
Course types	Vorlesung 10h, Seminar 50h
Content	<p>Topics include e.g. different mechanism of plants to acquire nitrogen, phosphorus (e.g. prior/after mineralization processes, via support by bacteria & fungi), and also micronutrients, competition for nutrients between plants and soil microbes, rhizodeposition, dependence on abiotic factors, influence of invasive species.</p> <p>Other skills:</p> <ul style="list-style-type: none"> • Presenting a lecture on a specific topic • Moderating a discussion • Scientific writing of a mini-review (incl. literature search, citing correctly)
Title of courses	Nutrient acquisition by plants
Teaching and learning methods	Vorlesung, Seminar
Usability in other programs	Compulsory elective module according to §9(7) Examination regulations Master AGES
Duration	1 Semester

Frequency of module offer	annually in summer semester
Teaching language	Englisch

Compulsory elective modules II: Society and environment

Marketing research

Module number / code	E05M
Module name	Marketing research
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students</p> <ul style="list-style-type: none"> • are able to describe how marketing research relates to the marketing concept • are able to outline the steps in the marketing research process and show how the steps are interrelated • know the factors to consider in defining the marketing problem or opportunity • are able to develop a research design • are able to state the specific advantages of the most important methods of data collection • know the different types of statistical analysis techniques
Course types	Vorlesung 30h, Seminar 30h
Content	<ul style="list-style-type: none"> • Tasks and management of marketing research • Methods of data collection • Methods of data analysis • Presentation of market research results for decision support • Methods of development prognoses
Title of courses	Marketing research
Teaching and learning methods	Vorlesung, Seminar
Usability in other programs	Compulsory elective "Business" according to §7(3) Examination regulations Master IFBC Compulsory elective according to §9(8) Examination regulations Master AGES; Method module

Lecturer(s)	Prof. Dr. B. König
Media used	Lecture slides, multimedia, case studies, guest lectures
Recommended literature	A reading list will be provided on the e-learning platform

Rural sociology

Module number / code	E21
Module name	Rural sociology
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	One of the primary objectives of this course is to introduce students to the principles of sociology in general and key concepts of rural sociology in particular. In addition, we want to provide the analytical tools for understanding the processes inherent to these concepts. Beyond that, the course aims at enhancing students' ability to identify different research perspectives and to critically discuss and analyse research strategies and methods.

Course types	Seminar 60h
Content	As an introduction to rural sociology, this course is designed to give an overview of the sociological concepts of “demographic change”, “social structural developments and social problems in rural areas” (deprivation, rural poverty): Lectures outline each of these issues and position them within the context of sociology. We will use seminars to debate key questions raised during lectures and to discuss selected issues based on academic publications.
Title of courses	Rural sociology
Teaching and learning methods	Lecture, Seminar
Usability in other programs	Compusory elective module according to §9(8) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-
Student workload	180h, of which 56 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Oral presentation (appr. 30min) Grade weighting P1: 50% Examination P2: Written report (appr. 8000 words) Grade weighting P2: 50%

Media used	verschiedene
Recommended literature	Adequate literature is presented in the lecture; text book chapters supply basic knowledge and are complemented by scientific publications.

Critical perspectives on the global food system

Module number / code	E39
Module name	Critical perspectives on the global food system

Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students</p> <ul style="list-style-type: none"> • will be aware of development trends of the global food system • will be aware of political ecology (PE) and critical agrarian studies (CAS) as approaches to analyze the food system and natural resource extraction • will be familiar with food regime theory to conceptualize the global food system • will be familiar with different conceptions of society-nature relationships • will have an overview of relevant methods of CAS and PE • will be able to critically evaluate and apply the corresponding approaches • will be knowledgeable about a contextual assessment of agri-environmental change and related implications • will be acquainted with transition and transformation studies, including “Commoning” approaches in the food systems
Course types	Seminar 60h
Content	The course provides an overview of influential critical approaches to understanding the development and problems of the global food system. At the macro level, it reflects on global food system trends from the viewpoint of food regime theory and critical agrarian studies. It continues introducing the contextual approaches and ideas of political ecology and critical agrarian studies and it exemplifies and allows critical discussion of these approaches through case illustrations and presentations. Moreover, the methods applied in political ecology and critical agrarian studies will be introduced and their application discussed. To round off the course, trending approaches to transforming the global food system are discussed and evaluated.
Title of courses	Critical perspectives on the global food system
Teaching and learning methods	Seminar
Usability in other programs	Compusory elective module according to §9 (8) Examination Regulations Master AGES
Duration	1 Semester

Recommended literature	

EU policies, organic farming and food system transformation

Module number / code	E41
Module name	EU policies, organic farming and food system transformation
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	The students deal with selected key issues of food-related European agricultural, environmental and health policies that are relevant to the sustainability transformation of food systems and farming. A particular focus will be on organic agriculture and relevant support measures. They work on these policies in a project-oriented way and apply concepts and methods of knowledge integration, policy process analysis and conceptualizations of the science-policy interface. This enables them to transfer the knowledge that they have also acquired in agricultural policy and governance courses to concrete issues and to link them to particular European and international contexts. At the same time, the aim of the course is to make students from Europe and beyond familiar with the relevance of these dimensions for their future professional life and to understand European organic agriculture and food system policies through discussions from the perspectives of different regional contexts.
Course types	Lecture 14h, seminar 12h, excursion 24h
Content	Increasingly, agricultural production is being considered as part of larger food systems. Policies and governance play a core role in the structuring of these food systems and should therefore also be of core relevance to their transformation. To start with, the lecturers introduce the food system concept and the role policies and governance play in this and how these aspects are analyzed. A focus will be on organic support policies. Students then work on selected current affairs issues of European Food System governance and transformation from different perspectives in topic-related small groups which are accompanied by the lecturers. Each group first develops the project concept (definition of a research question, methodological approach). These project concepts are presented by the different groups and discussed in the plenary before the small group projects are

	<p>implemented. At the end of the semester, all groups present and produce a report on their project results. Finally, the project results are discussed from both the European and the international perspective.</p> <p>Parallel to working on these key issues, students learn about methods of knowledge integration (e.g. system analysis, multi-criteria analysis), and policy process analysis and they are able to apply these methods.</p> <p>A central part of the course is the excursion to Brussels where the current affairs issues addressed during the session will be discussed with stakeholders. It enables students to get to know different perspectives and gain deeper insights for their own project work.</p>
Title of courses	EU policies, organic farming and food system transformation
Teaching and learning methods	Lecture, project-oriented group work supervised by lecturers, excursion
Usability in other programs	Compulsory elective module according to § 9 (8) PO Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	Students ideally attend at least one of the Master level courses of the Section of International Agricultural Policy and Environmental Governance before they attend this course.
Required prerequisites for participation	-
Student workload	180h, of which 60 contact hours
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Examination P1: Group presentation (ap. 30min) Grade weighting P1: 50% Examination P2: Group report (appr. 2500 words per person) Grade weighting P2: 50%
Credit points (ECTS)	6 cp
Teaching unit	Landwirtschaft, Int. Agrarentw. u. Ök. Landwirtschaft
Responsible person	Dr. J. Sanders
Lecturer(s)	Dr. J. Sanders
Media used	diverse
Recommended literature	Literature und publications will be provided for the course; Vedung, E. 1997: Public policy and program evaluation. Transaction Publishers, New Brunswick, London; Scholz, R.W., Tietje, O. 2002: Embedded case study methods: Integrating quantitative and qualitative knowledge. Sage Publications, Thousand Oaks.

Sustainable food systems and management

Module number / code	E47
Module name	Sustainable food systems and management
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>The aims of the module are:</p> <ul style="list-style-type: none"> • To deepen the students' understanding of the role of food business and other actors in the food system in society and the social responsibility and accountability issues that arise in a global business setting; • To familiarize students with the concepts and frameworks used in responsible and sustainable food business, to meet stakeholders' interests; • To provide students with the knowledge and confidence to critically reflect corporate practice and companies' use of different sustainability concepts and claims; • To raise awareness for different perspectives which provide contrasting and competing ways of making sense of sustainable food systems and responsible food business practices therein.
Course types	Seminar 60h
Content	<ul style="list-style-type: none"> • Food systems and societies; • Intercultural aspects and outcomes of food systems; • Organisation types and sustainability in food systems; • Corporate social responsibility, governance and accountability; • International developments in and governance of environmental and social reporting; • The management of global value chains in the agri-food sector; • Social and environmental responsibility in supply chain management; • The management and reporting of environmental and social information in different complex organisational and interorganisational settings); • The contrasting perspectives in social responsibility and accountability of business across borders.
Title of courses	Sustainable food systems and management
Teaching and learning methods	Lecture, seminar, group work
Usability in other programs	Compulsory elective module according to §7(3) Examination regulations Master IFBC Compulsory elective module according to §9(8) Examination regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in winter semester
Teaching language	Englisch

Sustainability-oriented environmental social science

Module number / code	K01
Module name	Sustainability-oriented environmental social science
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Students learn basic concepts of (environmental) social science. This will enable them to understand issues at the human-environment interface from a social science perspective as well. Learned qualification goals are:</p> <ul style="list-style-type: none"> • Basic understanding of social scientific thinking • Basic understanding of social theory • Competencies in the psychology of environmental behavior • Competencies in environmental social psychology • Competencies in environmental sociology • Basic understanding of important models • Learning of strategies of environmental education and environmental communication <p>A special goal of the module is to teach how people perceive environmental and sustainability problems on the one hand, and on the other hand, which interventions are conceivable to change environment-related behavior. The module is general from a theoretical point of view, but will be based on examples related to agriculture.</p>
Course types	Lecture 30h, seminar 30h

Content	Fundamental theories and concepts in environmental social science with a particular emphasis on sustainability transformations. These include: psychology of pro-environmental behaviour, environmental sociology, environmental justice. The course also outlines general epistemological concepts needed to understand the environment from a social science perspective. It further delves on modern human-environmental anthropologies such as Bruno Latour and Philippe Descola. It exemplifies these issues with empirical contributions on agriculture, food production and consumption with a particular focus on the global south.
Title of courses	Sustainability-oriented environmental social science
Teaching and learning methods	Lecture, Seminar, Paper-Workshops, Videocontent, Learning Games, Co-Teaching
Usability in other programs	Compulsory elective module according to § 9(8) Examination Regulations Master AGES
Duration	1 Semester
Frequency of module offer	annually in summer semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-

Climate change governance

Module number / code	K02
Module name	Climate change governance
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Upon Successful completion of this course, students are able to:</p> <ul style="list-style-type: none"> • Understand of key scientific concepts related to climate change, including climate change adaptation and mitigation, resilience, tipping points and path dependency using examples (including in agriculture) • Understand the three pillars of climate policy governance and their implementation and operationalisation in international and national frameworks • Have a thorough understanding and examples of concrete mitigation and adaptation measures • Analysing and interpreting scientific literature dealing with climate change concepts.
Course types	Vorlesung 15h, Seminar 45h
Content	<p>This course delves into the multidimensional aspects of climate change governance through the lens of scientific literature. Students will explore key concepts of climate change, the pillars of CC governance, mitigation, adaptation and means of implementation, drawing upon examples from agricultural sciences. Thereafter, climate change tipping points will be addressed, including adaptive pathways and their implications for policy and decision making.</p> <p>In the Seminar, students will present approaches to mitigate and adapt to climate change. Funding, including concise examples of payment schemes will also be addressed to obtain a full overview of historic developments, scientific approaches and hands-on examples of climate change governance on a local to global scale.</p> <p>Through critical analysis and discussion, students will gain insights into the complexities and challenges associated with climate change and examine how literature can offer concepts that help operationalize these cross-cutting issues.</p>
Title of courses	Climate change governance
Teaching and learning methods	Lectures in hybrid format presentation of scientific evidence, relevant case studies, documentaries and group discussions.
Usability in other programs	Compulsory elective module according to §9(8) Examination Regulations Master AGES
Duration	1 Semester

Sustainable? Development?

Module number / code	K03
Module name	Sustainable? Development?
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	The terms "sustainability" and "development" are often perceived as synonymous. At the same time, "sustainable development" can also be understood as an oxymoron. The module aims to provide students with "Global South" competence and development competence, to make them capable of speaking in the area of development cooperation and the closely related area of sustainability transformation. At the same time, it aims to sensitise students to specific problems in the Global South. In addition, it aims to impart discursive skills in dealing with contrasting theories (such as liberal modernisation theory vs. postcolonial theory).
Course types	Vorlesung 30h, Seminar 30h
Content	The module thematises and problematises both terms. It teaches basic skills in the area of sustainability:

	<ul style="list-style-type: none"> • Strong vs. weak sustainability • Efficiency, sufficiency, consistency • Triple bottom line vs. integrative concepts • Multispecies sustainability • International agreements, such as the Brundtland Report, MDGs, SDGs, UNFCCC etc. <p>As well as basic theories of development:</p> <ul style="list-style-type: none"> • Modernisation theories • Dependency theories • World system theories • Post-colonial and post-development perspectives • Global South concepts (Buen Vivir, Sumak Kawsay, Ubuntu) <p>Building on this, it will be discussed to what extent sustainability is an agenda of the Global North, but development is an agenda of the Global South, where they can strengthen each other, but also contradict each other.</p>
Title of courses	Sustainable? Development?

Environment and health

Module number / code	K04
Module name	Environment and health
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Upon successful completion of the module a student will be able to</p> <ul style="list-style-type: none"> • Understand key concepts related to health and environmental effects, encompassing the physical, social, cultural, political, and economic environments. • Acquire knowledge about the implications of environmental factors on human health, such as air quality, water quality, climate change, and infectious diseases. • Gain an understanding of the interconnectedness between human activities and the environment within the context of public health. • Develop the ability to critically understand health risks associated with various environmental exposures. • Cultivate critical thinking and analytical skills regarding health and environmental issues and their effects. • Understand the scientific principles and evidence underlying the interrelationships between human health and the environment, with a focus on global health implications. • Learn to critically read and interpret public health literature, emphasizing health and environmental effects.
Course types	Vorlesung 30h, Seminar 30h

Content	The "Environment and Health: Impact of Human Environmental Interactions on Health Issues" course is designed to understand the connections between health and the environment, introducing students with key concepts across various dimensions of global health. Students will examine the complex relationships within physical, social, cultural, political, and economic environments in the context of health. Topics include the impact of environmental factors on human health, such as air and water quality, climate change, and infectious diseases. Using a multidisciplinary approach, students will gain insights into the interconnectedness of human activities and the environment, emphasizing contextual understanding in global health. The course focuses on developing critical thinking and analytical skills for assessing health risks associated with diverse environmental exposures. Students will learn to critically read and interpret public health literature, with a specific focus on understanding the effects on health and the environment.

Education for sustainable development and agriculture

Module number / code	K05
Module name	Education for sustainable development and agriculture
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>This module examines the fundamental role of education in achieving a sustainable future. It explores the theoretical foundations and practical applications of ESD principles, equipping students with the knowledge and skills necessary to make informed decisions and know-how of effective knowledge transfer and contribute to positive change. Course Objectives:</p> <ul style="list-style-type: none"> • Develop a comprehensive understanding of ESD: Explore the origins, key concepts, and principles of ESD as outlined by UNESCO and other international frameworks within the sustainable development framework. • Critically evaluate various teaching and learning methodologies: analyse how different pedagogical approaches, such as project-based learning, experimental and active learning, gamification, and co-creation, can effectively foster sustainability literacy, critical thinking, and problem-solving skills. • Develop and implement practical tools and strategies: You will gain practical skills in curriculum design, lesson planning, and assessment methods tailored explicitly for promoting ESD. • Promote collaboration and knowledge exchange: By fostering active participation, dialogue, and collaboration throughout the course, we will cultivate a supportive learning environment that encourages diverse perspectives and co-creation of knowledge on sustainable solutions. <p>Course Learning Outcomes:</p> <ul style="list-style-type: none"> • Explore the interrelationships between environmental, social, and economic sustainability and learn about the Sustainable Development Goals (SDGs). • Design and implement learning activities that promote critical thinking, joint problem-solving, negotiation, communication and collaborative decision-making in the context of sustainability. • Effectively communicate and knowledge transfer methods to diverse audiences based on classified characteristics. • Contribute to building a more informed and engaged community capable of driving positive change towards a sustainable future.
Course types	Seminar 30h, Projektarbeit 30h
Content	<ul style="list-style-type: none"> • Learning to live with complexity and uncertainty • Concept of ESD, fundamentals and case studies • Transformative learning, social learning, and learning for change • Capacity building in knowledge management, behavioral change, and social innovation • Digitalization, digital transformation and ESD

	<ul style="list-style-type: none"> • Leadership for Sustainability: integrated problem-solving and communication skills • Gamification for ESD by stimulating creativity and innovation • Equity, values, ethics, and inclusion in education • Dynamics of Entrepreneurship • Systems thinking and future thinking for sustainability • Living Lab approach: applied research model to effect changes in the interest of sustainable development

One health: human, animal and environmental interactions

Module number / code	K06
Module name	One health: human, animal and environmental interactions
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>Upon successful completion of the module a student will be able to</p> <ul style="list-style-type: none"> • Understand key concepts related to the interconnectedness of human, animal, and environmental health, including social, cultural, economic, political, and sustainability factors. • Acquire knowledge about the mechanisms of disease emergence and the role of human-animal-environment interactions in the spread of infectious diseases. • Gain an understanding of the principles and practices of pandemic preparedness, emphasizing the One Health approach. • Develop the ability to critically assess the impact of agricultural practices on land use, ecosystems, food security, and health outcomes. • Develop critical thinking and analytical skills regarding the decolonization of global health, focusing on historical perspectives and equity. • Understand the scientific principles and evidence underlying the impacts of climate change on health, including shifting disease patterns and agricultural sustainability. • Learn to critically read and interpret One Health literature, emphasizing interdisciplinary approaches to health and environmental issues.
Course types	Vorlesung 30h, Seminar 30h
Content	<p>This course, "One Health: Human, Animal, and Environmental Interactions," explores the interconnectedness of human, animal, and environmental health through a multidisciplinary lens. Students will examine how social, cultural, economic, political, and climate change factors influence health outcomes. The course will explore into the mechanisms of disease emergence, emphasizing the role of human-animal-environment interactions in the spread of infectious diseases. Furthermore, it will address strategies for pandemic preparedness, highlighting the importance of a One Health approach in preventing and managing global health crises. Agricultural practices, considering their effects on land use, ecosystems, food security, and their implications for health outcomes will be incorporated. Additionally, the course will explore the concept of decolonizing global health, focusing on the historical perspectives of global health and equity. Through this exploration, students will gain a holistic understanding of the complex factors that contribute to health in our interconnected world of humans, animals, and environments.</p>

Philosophy of sciences

Module number / code	K21M
Module name	Philosophy of sciences
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>In view of the plural constitution of scientific cultures and the different understandings of scientificity associated with them, a reflection on the ideals of science, the conceptions of methods and the conceptions of subject matter of the individual sciences is indispensable. This is especially true against the background of a required interdisciplinary cooperation of different sciences in the face of current crisis phenomena.</p> <p>In this module, students will be familiarized with the basic questions of the philosophy of sciences in an exemplary way. Through this, they acquire the ability to critically assess methodological and scientific ideals in the face of a variety of different individual sciences. They will acquire the competence to apply scientific theoretical considerations to concrete</p>

	cases of application in the practice of sciences. In particular, they will acquire the ability to reflect on the plurality of scientific cultures in the tension between sciences and humanities.
Course types	Seminar 30h
Content	Exemplary seminar courses introduce the basic issues and positions of the philosophy of science. The relevant classical approaches (logical empiricism, critical rationalism, revolutionary transformism, research program approach, anarchistic methodology, science in context, science studies, etc.) as well as the essential dynamics (linguistic turn, practical turn, iconic turn, spatial turn, etc.) are taken into account. In methodological terms, this also means the possible thematization of different areas of methodology (observations, experiments, model building, theories, etc.). The module is explicitly adapted to the plurality of individual sciences and in this respect takes into account the issues of the two-culture problem (humanities and natural sciences, science wars).

Philosophy of environment and society

Module number / code	K22
Module name	Philosophy of environment and society
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>The potential threats to our traditional ways of dealing with nature have a global dimension and are undeniably explosive. They create an urgent need for action, which, however, includes basic philosophical reflections. In all relevant fields of action it becomes clear that the protection of the environment and the quality of human life have to be thought together. Classical oppositions such as that of nature and society must be overcome. If philosophy is challenged here, then it is under the condition that the global problems of human-nature interaction imply, on the one hand, an intimate interconnection of questions of natural and social philosophy, and, on the other hand, the interaction of approaches in environmental philosophy and environmental ethics.</p> <p>The present module responds to these challenges. It has the task of demonstrating the necessity of a critical philosophical examination of the environment and society in order to solve the aforementioned problem areas. It aims to introduce students to the relevant topics and to demonstrate the connection between the aforementioned aspects in an exemplary way.</p> <p>Furthermore, the students acquire competences</p> <ul style="list-style-type: none"> • of free and independent oral reproduction • of analysis, argumentation, critical reflection and discussion of philosophical issues
Course types	Seminar 30h
Content	In exemplary seminars, topics of natural philosophy (e.g. the concept of nature, philosophy of the organic), environmental and bioethics (e.g. anthropocentrism, pathocentrism, biocentrism, holocentrism) and critical social theory (e.g. political economy, technological development, imperial ways of life) are reflected and discussed in their interconnectedness and interdependence on the basis of relevant texts and materials. In doing so, it is particularly important to work out the references to current crisis phenomena in the field of environment and nature (e.g. climate crisis, species extinction) as well as social developments (e.g. global exploitation relations, political polarization, gender and diversity) and to question their possible transformations.

Spatial dimensions of sustainability transitions

Module number / code	K61
Module name	Spatial dimensions of sustainability transitions
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	Students learn to examine the spatial dimensions of the current socio-ecological crisis as well as the implications of the urgently needed socio-ecological transformations for cities, landscapes and regions. On this basis, they will be introduced to different aspects of sustainability labs and experiments in urban, regional and landscape planning.
Course types	Seminar 60h
Content	<p>The seminar consists of three parts. In the first part, the notions of planetary boundaries, Anthropocene, sustainability transitions, transformations, living labs, etc. are introduced through lectures and group discussions.</p> <p>The second part is dedicated to student presentations based on 1-2 international journal articles each. These will cover topics such as</p> <ul style="list-style-type: none"> • Scaling and rescaling of niche experiments, • Participation and social selectivity, • Power in transformation processes, and • Success factors and enabling conditions. <p>Finally, in the third part, students are to prepare small case studies. The aim is to combine the findings from the international journal articles with cases (national or international) chosen individually by the participants.</p>

Decision support tools in sustainability management

Module number / code	K73
Module name	Decision support tools in sustainability management
Type of module	Elective module
Learning outcomes, acquired competencies and qualification goals	<p>In this seminar, students get acquainted with various tools that may support decision-making for multi-faceted sustainability performance. After a theoretical introduction on selected instruments including data envelopment analysis (DEA), decision-tree methodology, analytical hierarchy process (AHP) and system dynamics modelling, the students will gain in-depth practical experience by working with one selected tool. In the sense of a project seminar, the students successively develop a systems model for addressing a specific problem in the field of sustainability management, and then report and reflect on model-building procedure and findings.</p> <p>Goals and objectives:</p> <ul style="list-style-type: none"> • Get acquainted to decision support tools that are applicable for problems in the realm of sustainability management • Get in-depth insights and gain first experience in building a systems model • Reflect on the assets and limitations of various decision support tools • Gain experience in working in a team, in how to make decisions in a group and how to manage time and resources
Course types	Seminar 60h
Content	Tools that support decision-making when targeting sustainability performance of organisations and supply chains
Title of courses	Decision support tools in sustainability management
Teaching and learning methods	Seminar
Usability in other programs	Compulsory elective module according to §9(8) Examination regulations Master AGES
Duration	1 Semester, jährlich
Frequency of module offer	annually in winter semester
Teaching language	Englisch
Recommended (knowledge) prerequisites	-
Required prerequisites for participation	-

Student workload	180h, within 60h contact time
Required course work	
Prerequisites for examination(s)	
Module examination(s)	Oral presentation (appr. 30min) with outline (appr. 3.000 words)
Credit points (ECTS)	6 cp
Teaching unit	Wirtschaftswissenschaften
Responsible person	Prof. Dr. S. Gold
Lecturer(s)	Prof. Dr. S. Gold and staff
Media used	verschiedene
